

A Adaptive evaluation on nonsingleton buckets

Uniform $M = 100$ subset of a fixed population of $T = 1000$ labeled entries.

$$U_{J_1} = 10.1$$

$$U_{J_2} = 3.417$$

Entries in nonsingleton prefix buckets receive the next invariant.

Unresolved population pairs

$$J_1 = (101, 1^{899}), \quad J_2 = (5^{20}, 1^{900}), \quad J_3 = (2^{20}, 1^{960})$$

Expected total cost: 377.7

B Expected workload

Per-entry costs: $(c_1, c_2, c_3) = (1, 12, 40)$. Terminal pair cost: $f = 100$.

■ I_1 ■ I_2 ■ I_3 ■ fallback

At these costs, $I_1 \rightarrow I_2$ is cheaper than $I_2 \rightarrow I_1$, and adding I_3 further lowers the expected workload.
